Peptides that antagonize binding of transforming growth factor betal, useful for treatment of liver disease, especially cirrhosis, are partial sequences of the factor or its receptors.

Claim 9; Page 82; 86pp; Spanish.

The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGF) factor betal (TGF-bl) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-bl and/or its receptors. Peptides AAY92945-Y93133 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-bl to its receptors, e.g. they are inhibitors of srimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DMA (or expression systems) encoding the peptides are used for treatment of liver disease, specifically cirrhosis

signal peptide that is the same as the native signal peptide except that the 3 C-terminal amino acid residues are Ser-Trp-Ser The invention is directed to glycosylated leptin proteins (see AAA95799-804) that have a Stokes' radius greater than that of naturally occurring human leptin. A claimed method for manufacturing a glycosylated leptin involves culturing a host cell containing a DNA sequence encoding a signal peptide and a glycosylated leptin protein. Preferred signal peptides have a peptidase cleavage site optimized for glycosylation efficiency. When leptin+459+102 (see AAY95802) was expressed as a fusion with the present signal peptide, the degree of glycosylation (on a scale of 1-5) was 3.5 in COS host cells and 4 in CHO host cells. Glycosylated leptins, or nucleic acids encoding them, are used in the treatment of obesity, diabetes and the effects of high blood lipid content (claimed). They have longer systemic circulation times in vivo than native leptins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Glycosylated leptin proteins having a Stokes' radius greater than that of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        present sequence is that of a human tissue plasminogen activator
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         a naturally occurring glycosylated human leptin useful for treating obesity, diabetes and the effects of high blood lipid content.
                                                                                                                                                                                                        antiobesity, antidiabetic, hyperlipemic; therapy, signal peptide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGF) factor betal (TGF-bl) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-bl and/or its receptors. Peptides AAY92945-Y9313 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-bl to its receptors, e.g. they are inhibitors of stimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Hepatotropic, antagonist, transforming growth factor betal, TGF-bl, competitive inhibition, collagen synthesis stimulation inhibitor, liver, extracellular matrix degradation inhibitor; mimetope, cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Peptides that antagonize binding of transforming growth factor betal, useful for treatment of liver disease, especially cirrhosis, are partial sequences of the factor or its receptors.
                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel peptide or epitope which is prone to deamidation by tissue transglutaminase (tTG) and is a causative factor of cellac disease (CD, gluten intolerance) or an autoimmune disease such as rheumatoid arthritis, multiple sclerosis, systemic lupus erythematosus, sjogren syndrome or diabetes. The peptide of the invention demonstrates immunosuppressive, antirheumatic, antiarchritic, antidiabetic, dermatological and antiinflammatory activities whilst pharmaceutical compositions comprising the peptides or epitopes may be useful for the treatment of a celiac disease or an autoimmune disease such as rheumatoid

AAD05492-AAD05564 represent cDNAs corresponding to 22 human secreted

protein genes, and AAE01672-AAE01743 represent the proteins they encode.

AAE01744-AAE01751 represent human secreted protein fragments or variants.

CT he secreted proteins and their genes are useful for preventing, treating
or ameliorating medical conditions, e.g., by protein or gene therapy.

Extendedical conditions can be diagnosed by determining the amount of the
new protein in a sample or by determining the presence of mutations in
the new genes. Specific uses are described for each of the 22 genes,
consection that issues in which they are most highly expressed, and include
developing products for the diagnosis or treatment of proliferative
developing products for the diagnosis or treatment of proliferative
cdeveloping products for the diagnosis or treatment of proliferative

ò а Albumin fusion protein related therapeutic protein X, SEQ ID No 681 albumin fusion protein; cytostatic; antianaemic; antiarthritic;

```
The present invention relates to albumin fusion proteins comprising a therapeutic protein X and human albumin (HA, also known as human serum albumin, HBA). The proteins are useful for treating a disease or disorder that may be modulated by therapeutic protein X. The albumin extends the shelf-life of protein X, and may increase its biological in vitro/in vivo activity. The protein is useful for treating and diagnosing disorders ench as cancer, reproductive disorders, disestes (e.g. Crohn's disease, ulcerative colitis), immune disorders (e.g. acquired immunodeficiency syndrome, AIDS), endocrine disorders (e.g. diabetes), haematopoietic disorders, neural disorders (e.g. Alzheinmer's, Parkinson's, Creutzfeldt-Jacob disease, encephalomyelitis, meningitis, schizophrenia), and connective disorders (e.g. osteoporosis, arthritis).

ABG63326-ABG65518 represent albumin fusion proteins of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New fusion protein for treating disease e.g. diabetes comprises an albumin fused to a therapeutic protein.
                                                                                                                                         Albumin fusion protein; therapeutic protein X; human albumin; HA; human serum albumin; HSA; cancer; reproductive disorder; digestive disorder; immune disorder; endocrine disorder; haemacropoletic disorder; neural disorder; connective disorder; cytostatic; antiinfertility; antiinflammatory; antiulcer; immunemodulator; anti-HIV; antiinflammatory; antiulcer; neuroprotective; antiparkinsonian; antimicrobial; neuroleptic; osteopathic; antiarthritic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Length 18;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Score 34; DB 5; Le:

```
The invention relates to a novel albumin fusion protein. The invention further relates to: a composition comprising the albumin fusion protein and a pharmaceutical carities; a kit comprising the albumin fusion protein cormula; a method of treating a disease or albumin fusion protein; a method of treating a disease or disorder that is modulated by Therapeutic protein: X, or its fragment or variant; a nucleic acid molecule comprising a polymucleotide fragment or variant; a nucleic acid molecule comprising a polymucleotide comprising the albumin fusion protein; a vector comprising the nucleic acid molecule of the albumin fusion protein; and a host cell comprising the nucleic acid molecule of the albumin fusion protein; and a host cell comprising the nucleic acid molecule of the albumin fusion protein. The albumin fusion protein and its compositions have the following activities: expositefuc, antianaemic, antiarthing and a host cell activities: expositefuc, antianaemic, antiarthing antiarchmatic, antiarchmatic, costeopathic, dermatological, antiinflammatory, antipsoriatic, antidiabetic, antidiabetic
                                                                                     antiasthmatic; anti-HIV; immunosuppressive; antiinflammatory; antisethmatic; anti-HIV; immunosuppressive; antiinflammatory; antipproriatic; antibacterial; osteopathic; dermatological; antigout; immunomodulator; antiarrhythmic; cardiant; nootropic; antilipaemic; nephrotropic; uropathic; neuroprotective; antiparkinsonian; tranquilizer; antidabetic; anabolic; hypertensive; vulnerary; gene therapy; cancer; reproductive system disorder; therapeutic protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           arrhythmia, cardiac arrest, heat valve disease, hypernatraemia or hyponatraemia), mixed foetal diseases (e.g. foetal alcohol syndrome, Down's syndrome, Parau syndrome, Turner's syndrome, Apert syndrome or Tay Sachs disease), excretory diseases (e.g. urinary incontinence, urinary tract infections or renal diseorders), neural or sensory disease (e.g. Alzheimer's disease, Parkinson's disease, cerebral malaria, meningitis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            or ameliorating diseases or disorders e.g. cancer, anemia, arthritis, asthma, inflammatory bowel disease or Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New albumin fusion proteins, useful for diagnosing, treating,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Disclosure; SEQ ID NO 681; 279pp; English.

         compulsive disorder), respiratory disease (e.g. emphysema, lung cancer or occupational lung disease), endocrine diseases (e.g. diabetes, Addison's disease or glomerulonephritis), digestive diseases (e.g. portal hypertension, irritable bowel disease, gastric atrophy or pancreatitis) or connective tissue or epithelial diseases (e.g. Crohn's disease, scleroderma, wound healing or epidermolysis bullosa). This sequence represents a therapeutic protein X relating to the albumin fusion protein of the invention. The sequence listing data for this specification was dowloaded from the USPTO website.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is a peptide which binds to thrombopoietin (TDO) receptor (TR). The compound can be used for treating patients suffering from hammatological disorders and thrombocytopenia resulting from chemotherapy, radiation therapy or bome marrow transfusions. The peptide may also be used to maintain the proliferation and growth of TPO-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present peptide, which binds the thrombopoietin receptor (TR), can be used to treat disorders which are susceptible to treatment with a thrombopoietin agonist, preferably haematological disorders and thrombocytopaenia resulting from chemotherapy, radiation therapy or bone marrow transfusions. It can also be used diagnostically, e.g. to investigate the mechanism of thrombopoietin signal transduction and receptor activation, or to maintain the proliferation and growth of
                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                    The present peptide, which binds the thrombopoietin receptor (TR), can be used to treat disorders which are susceptible to treatment with a thrombopoietin agonist, preferably haematological disorders and thrombopoietin agonist, preferably haematological disorders and thrombocytopaenia resulting from chemotherapy, radiation therapy or bone marrow transfusions. It can also be used disgnostically, e.g. to investigate the mechanism of thrombopoietin signal transduction and receptor activation, or to maintain the proliferation and growth of thrombopoietin dependent cell lines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Modified peptide; therapeutic agent; fusion; Fc domain; cancer; autodimune disease; cytostatic; antiackhmatic; thrombolytic; VEGF; immunosuppressive; BPO; TPO; CTLA4; mimetic; IL-1; TNF; antiagonist; MMP; inhibitor; erythropoietin; thrombopoietin; interleukin 1;

The present invention describes composition of matter (I) comprising an CF domain, pharmacologically active peptides, and linkers. Where (I) is:

(X1)a-F1-(X2)b, where: F1 = an C domain; X1 and X2 = are each
independently selected from -(II)C-P1, -(II)C-P1-(L2)d-P2, -(IL)C-P1-
(IL2)d-P2-(L3)e-P<sup>3</sup>; or -(IL)-P1-(L2)d-P3-(L3)e-P3-(L4)f-P4 where P1, P2, P3, and P4 = are each independently sequences of pharmacologically active C peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, C c, d, e, and f = are each independently or 1, provided that at least 1 c peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, C c and b is 1. The composition can have cytostatic, antisathmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions cuch as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to AAB18003 represent uncleotide and amino acid sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                haemostatic; thrombocytopenia; chemotherapy; radiation therapy; ELISA; boom marrow transplantation; haematological disorder; platelet disorder; enzyme-linked immunosorbent assay; in situ situ staining; biological fluid; tissue homogenate; fluorescence-activated cell sorting; Western blotting;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Peptide mimetic; human; thrombopoietin receptor; TPO-R; TPO; cytokine;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            BXBXXX
                                                                                                                                                                                                                                                                                                                                                                      Sequences AAU25815-AAU26049 represent peptides and peptide mimetics that bind to and activate the human thrombopoietin receptor (TPO-R). Methods of activating thrombopoietin receptors in cells compracted contacting the cells with effective amounts of peptides and peptide mimetics attached to hydrophilic polymers. The methods are used to treat thrombocytopenia such as that due to chemotherapy, radiation therapy or bone-marrow transplantation and to prevent thrombocytopenia in patients at risk. The sequences are used to treat and prevent haematological disorders including thrombocytopenia and platelet disorders. They are used in vitro as unique tools for understanding the biological role of thrombopoietin (TPO) and to develop other compounds that bind to and activate the TPO receptor. The peptides can be used to detect TPO receptors on living cells and fixed cells, in biological fluids, in tissue homogenates, and in purified or natural biological materials. They may also be used for in situate taining, fluorescence-activated cell sorting, Western blotting and centre candom materials. They may also be used for in situate dimmunosorbent assay (ELISA). In addition, the peptides can be used for in vitro expansion of megakaryocytes and their committed progenitors alone or in conjunction with additional cytokines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

ultimers. (I) can have antiinflammatory, antitumour, immunosuppressive, cytostatic, antirheumatic antiarthritic, antidiabetic, ophthalmological, antitheumatic, antiarthritic, antidiabetic, ophthalmological, cantendectic, antirheumatic, antidiabetic, dermatological antiansemic, anorectic, antinherthilty, haemostatic, dermatological antiansemic, anorectic, antinherthilty, haemostatic of antiophylactic agent as well as for screening purposes. (I) is useful for diagnostic agents of an ideases characterised by dysfunction of their sesociated protein of interest, for identifying normal or abnormal proteins of interest in a blological sample. Additionally, (I) is useful for treating interest in a blological sample, Additionally, (I) is useful for treating inflammatory and autonimmune diseases, tumour growth, cancer, rheumatoid arthritis, diabetic retinopathy, obesity, sleep disorders, inflammatory and autonimmune diseases, tumour growth, cancer, rheumatoid arthritis, diabetic retinopathy, obesity, sleep disorders, inflammatory and servological degenerative diseases. (I), comprising for mimetic compounds are useful for treating disorders characterised by low red blood cell levels such as anaemia. The TPO-mimetic comprising megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet deficiency or and servinement antion of the present invention expensed in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

This invention relates to novel mammalian CDR mimetibodies, specific portions or variants thereof. Specifically, it refers to an antibody fragment where a protein has been inserted into, or replaces a portion of fragment where a protein, such that each CDR mimetibody comprises at least one portion of a heavy chain or light chain variable region, which itself comprises at least one human framework region and at least one ligand binding region (LBR). The present invention describes human mimetibodies, including modified immunoglobulins and cleavage products that can be useful in gene therapy and the generation of transgenic plants and animals. Furthermore, the CDR mimetibodies, so including modified immunoglobulins and cleavage products that can be useful in gene therapy and the generation of transgenic plants and animals. Furthermore, the CDR mimetibody of suggeth symptoms of immune, cardiovascular, infectious, malignant and/ or neurologic diseases, as well as anaemia. Accordingly, they exhibit immunomodulator, cardiant, antimicrobal, cytostatic and neuroprotective activities. This peptide sequence is a TPO mimetic peptide sequence used to make a minetibody of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ô

This invention relates to CH1 deleted mimetibodies (and the DNA sequences which encode them), compositions, methods and uses. The invention may be useful for the development of compounds with an immunosuppressive, cardiant, hypotensive, neuroprotective, nootropic, cardiavascular, cardiant, hypotensive, neuroprotective, nootropic, antibacterial, virucide or fungicide activity. In addition, the disclosed sequences may prove useful for gene therapy. The CH1-deleted mimetibody is useful for diagnosing or treating a disease condition in a cell, is useful for diagnosing or treating a disease condition in a cell, is useful for diagnosing or treating a disease condition on a cell, is useful for diagnosing the incidence or reducing the symptoms of an immune, cardiovascular (for example arrhythmia, hypertension or heart failure), or neurodegenerative (for example multiple sclerosis, dementia or Alzheimer's disease) diseases (for example bacterial, viral or conditions, or infectioned diseases (for example bacterial, viral or fungal infection). The present sequence is that of a peptide which may be used during the creation of a mimetibody of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                        New CH1-deleted mimetibody polypeptides and nucleic acids, useful for modulating, treating, alleviating, preventing an immune, cardiovascular, or neurodegenerative disease or disorder, anemia, cancer, or infectious
                                                                                                                                                                                                                                                                                                                                  Ghrayeb J, Scallon BJ, Nesspor TC;

FBBS Lett. 516:183-186(2002).
-!- CATALYTIC ACTIVITY: An aldehyde + NAD(+) + H(2)O = an acid + NADH.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Duve H., Johnsen A.H., Scott A.G., East P., Thorpe A.;

[Hyp3]Met-callatostatin. Identification and biological properties of a novel neuropeptide from the blowfly Calliphora vomitoria.";

J. Biol. Chem. 269:21059-21066 (1994).

-!- FUNCTION: May act as a neurotransmitter or neuromodulator and play a role in the integration of information within the brain. May be involved in the control of visceral muscles due to its ability to behave as potent inhibitors of peristalic movements. May also thifill a neurohormonal role on muscles of the gut and heart.
-!- TISSUE SPECIFICITY: Neurons within brain and abdominal ganglion.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            - SUBUNIT: Honotetramer.
- MISCELLANEOUS: Optimal pH is 9-10. The Km for acetaldehyde mm and Vmax is 1.3 micromol/min x mg enzyme.
- SIMILARITY: Belongs to the aldehyde dehydrogenase family.

1 EAVLILQGPPYVSWL 15 Title: Perfect score: Sequence:

Scoring table:

BLOSUM62 Gapop 10.0 , Gapext 0.5

Total number of hits satisfying chosen parameters:

283416 segs, 96216763 residues

Searched:

Minimum DB seq length: 0 Maximum DB seq length: 23

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

Database :

PIR 79:\*
1: pirl:\*
2: pir2:\*
3: pir3:\*
4: pir4:\*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
